Mission:

Build Python data science
environment from USB key

Assumption: you know what
platform you will deploy the
environment on

Step 0: run the prep steps
on the target platform
(Docker container FTW)

Step 1: install Python with custom Miniconda

Conda Constructor

`construct.yaml`

Similar to `environment.yml`

Result: a Python & goodies
installer

Look ma no root needed!

Step 2: wheel packages
you can only get from
PyPI

Have requirements.txt
From the env made by Conda
Constructor:

```
pip wheel -w my_wheels \  
-r requirements.txt
```

Step 3: put
my_conda.sh
my_wheels/
requirements.txt
on your USB key

Hike up the mountain
It's deploy time!

```
sh /media/usbkey/my_conda.sh  
# Let it conda init, then restart shell  
pip install --no-index --find-links \  
    /media/usbkey/my_wheels \  
    -r /media/usbkey/requirements.txt
```

And then just code away 🙌

Don't forget the ☂️
It's not called Mt. Sunnier
